| **Program** | 1. Introduction  
| | 1.1. Target problems  
| | 1.2. Rosenblatt's Perceptrons  
| | 1.3. Advantages and disadvantages of Perceptrons  
| | 1.4. Multilayer perceptron  
| | 1.5. Feed-forward and RBF Networks  
| | 2. Training algorithms  
| | 2.1. Backpropagation algorithm  
| | 2.2. Logistic regression and perceptrons  
| | 2.3. MAP and ML training  
| | 3. Learning and Optimization  
| | 3.1. Training as Error Minimization  
| | 3.2. Gradient Descent  
| | 3.3. Higher Order Descent  
| | 3.3.1. Newton's Method  
| | 3.3.2. Gauss-Newton Method  
| | 3.3.3. Levenberg-Marquardt Method  
| | 3.3.4. Quasi-Newton Method  
| | 3.4. Generalization and optimization  
| | 3.5. Online Learning  
| | 4. MLPs in practice  
| | 4.1. Data preprocessing  
| | 4.2. Network initialization  
| | 4.3. Tuning network structure  
| | 4.4. Weight decay  
| | 4.5. Fast training: Extreme Learning Machines  
| | 4.6 Practical data modelling with neural networks  
| | 5. Deep Networks  
| | 5.1. The problem of learning several hidden layers.  
| | 5.2. Whole-network training  
| | 5.2.1. Deep networks initialization  
| | 5.2.2. Parallel training  
| | 5.2.3. Advanced optimization methods  
| | 5.3. Incremental training  
| | 5.3.1. Autoencoders  
| | 5.3.2. Restricted Boltzmann Machines (RBM)  
| | R. Duda et al. *Pattern classification*.  
| | C. Bishop, *Neural networks for pattern recognition*. |
T. Hastie et al., *The elements of statistical learning*

G. Hinton, *Practical Guide to Training Restricted Boltzmann Machines*
